

IT Helpdesk Ticket Scenarios - Troubleshooting & Resolutions

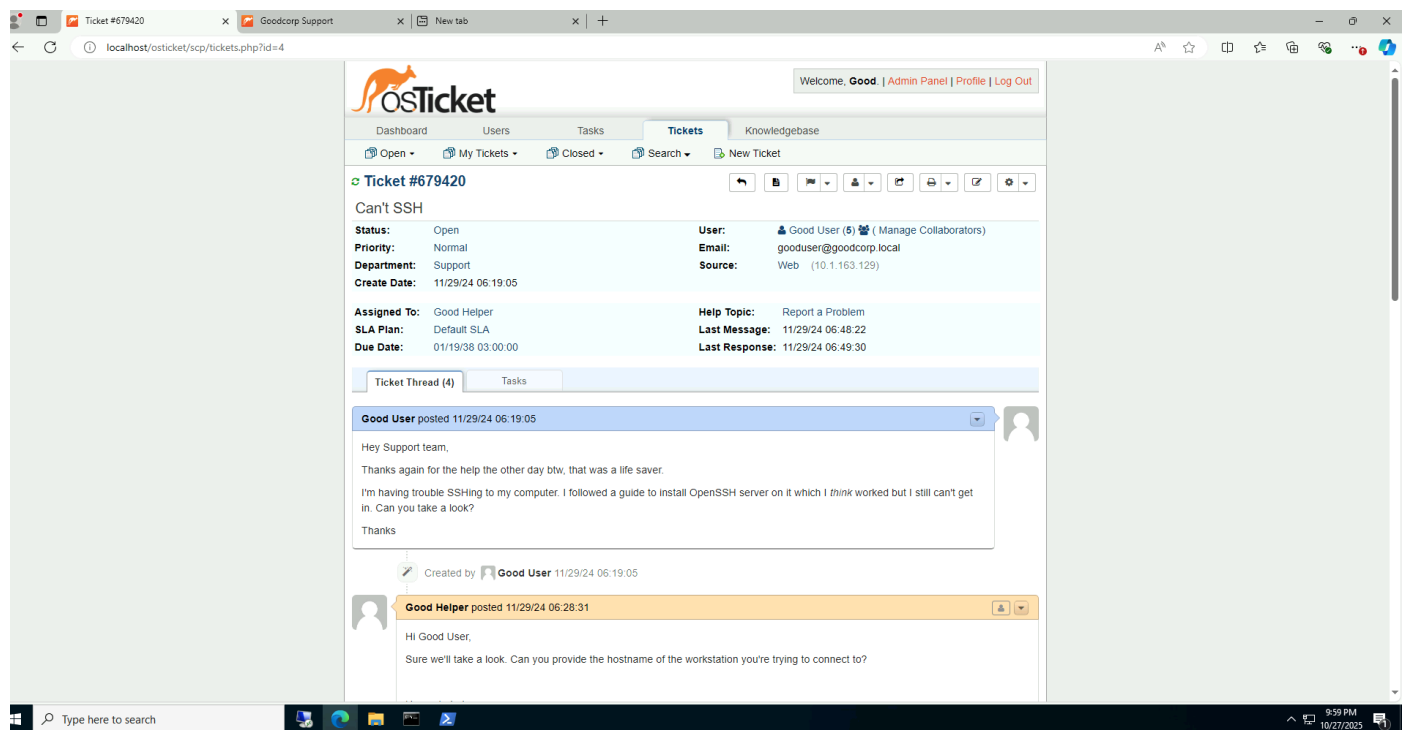

Overview:

This document shows four real-world Helpdesk scenarios I completed using the LevelEffect lab environment using Windows Server, Active Directory and a Windows 10 client machine. These incidents demonstrate core IT support skills including service troubleshooting, SSH configuration, DNS repair, file recovery and account administration.

Each scenario included the original ticket, root-cause analysis and the technical resolution I performed

Scenario 1: Service Failure - SSH Connectivity Issue

Ticket Summary:

The screenshot displays the oSTicket web interface in a browser window. The ticket details for #679420 are as follows:

Ticket #679420	
Status: Open	User: Good User (5) (Manage Collaborators)
Priority: Normal	Email: gooduser@goodcorp.local
Department: Support	Source: Web (10.1.163.129)
Create Date: 11/29/24 06:19:05	
Assigned To: Good Helper	Help Topic: Report a Problem
SLA Plan: Default SLA	Last Message: 11/29/24 06:48:22
Due Date: 01/19/38 03:00:00	Last Response: 11/29/24 06:49:30

The ticket thread shows two messages:

- Good User posted 11/29/24 06:19:05:** Hey Support team, Thanks again for the help the other day btw, that was a life saver. I'm having trouble SSHing to my computer. I followed a guide to install OpenSSH server on it which I *think* worked but I still can't get in. Can you take a look? Thanks
- Good Helper posted 11/29/24 06:28:31:** Hi Good User, Sure we'll take a look. Can you provide the hostname of the workstation you're trying to connect to?

Symptoms:

- SSH attempts failed when connecting remotely
- OpenSSH Server installation uncertain
- User cannot authenticate into the workstation

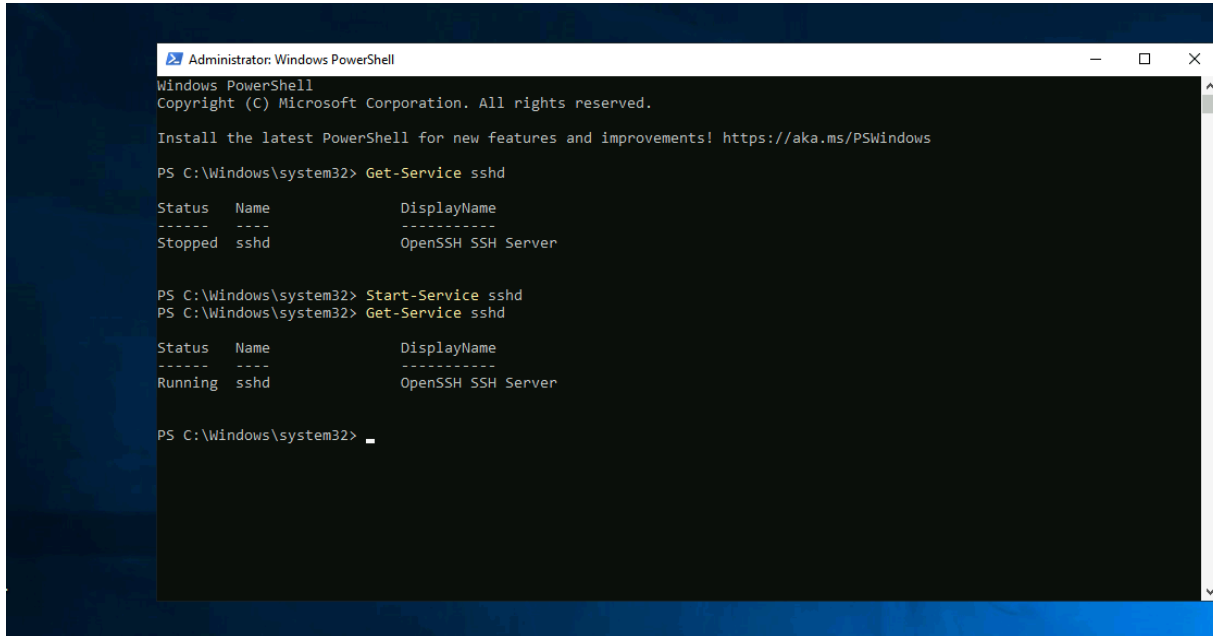

Possible Causes

- OpenSSH service not running
- Firewall rules blocking port 22
- Misconfigured SSH settings

- Network or IP issues

Resolution (What I did)

1. Logged into both the Domain Controller and WS1 Workstation
2. Checked the SSH service status and then started it with the command below:

```
Administrator: Windows PowerShell
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Install the latest PowerShell for new features and improvements! https://aka.ms/PSWindows

PS C:\Windows\system32> Get-Service sshd

Status  Name      DisplayName
-----
Stopped sshd      OpenSSH SSH Server

PS C:\Windows\system32> Start-Service sshd
PS C:\Windows\system32> Get-Service sshd

Status  Name      DisplayName
-----
Running sshd      OpenSSH SSH Server

PS C:\Windows\system32> _
```

4. After that I tried to SSH into the computer to see if that was the sole problem and it still didn't work.
- 5 So after that I checked the firewall rules and was able to find that the OpenSSH firewall rule was disabled
6. After enabling this rule, SSH access worked successfully

The screenshot shows a Windows terminal window with the following content:

```

PS C:\Windows\system32> Get-NetFirewallRule | Where-Object DisplayName -like "*ssh*"

Name                           : OpenSSH-Server-In-TCP
DisplayName                     : OpenSSH SSH Server (sshd)
Description                     : Inbound rule for OpenSSH SSH Server (sshd)
DisplayGroup                    : OpenSSH Server
Group                          : OpenSSH Server
Enabled                         : False
Profile                         : Any
Platform                       : {}
Direction                     : Inbound
Action                         : Allow
EdgeTraversalPolicy             : Block
LooseSourceMapping             : False
LocalOnlyMapping               : False
Owner                          :
PrimaryStatus                   : OK
Status                         : The rule was parsed successfully from the store. (65536)
EnforcementStatus              : NotApplicable
PolicyStoreSource               : PersistentStore
PolicyStoreSourceType          : Local
RemoteDynamicKeywordAddresses  : {}
PolicyAppId                    :

PS C:\Windows\system32> Set-NetFirewall Rule -Name "OpenSSH-Server-In-TCP" -Enabled True
Set-NetFirewall : The term 'Set-NetFirewall' is not recognized as the name of a cmdlet, function, script file, or operable program. Check the spelling of the name, or if a path was included, verify that the path is correct and try
again.
Set-NetFirewall Rule -Name "OpenSSH-Server-In-TCP" -Enabled True
+ ~~~~~
+ CategoryInfo          : ObjectNotFound: (Set-NetFirewall:String) [], CommandNotFoundException
+ FullyQualifiedErrorId : CommandNotFoundException

PS C:\Windows\system32> Set-NetFirewallRule -Name "OpenSSH-Server-In-TCP" -Enabled True
PS C:\Windows\system32> Get-NetFirewallRule | Where-Object DisplayName -like "*ssh*"

Name                           : OpenSSH-Server-In-TCP
DisplayName                     : OpenSSH SSH Server (sshd)
Description                     : Inbound rule for OpenSSH SSH Server (sshd)
DisplayGroup                    : OpenSSH Server
Group                          : OpenSSH Server
Enabled                         : True
Profile                         : Any
Platform                       : {}
Direction                     : Inbound
Action                         : Allow
EdgeTraversalPolicy             : Block
LooseSourceMapping             : False
LocalOnlyMapping               : False
Owner                          :
PrimaryStatus                   : OK
Status                         : The rule was parsed successfully from the store. (65536)

```

The terminal window is titled "Windows Workstation" and shows the process of creating a firewall rule named "OpenSSH-Server-In-TCP". The initial command to get the rule returns an empty result. The subsequent command to set the rule fails with an error. Finally, the command to set the rule succeeds, and the final command to get the rule returns the rule details, showing it is now enabled.

Outcome

SSh Connection was restored and fully functional

Scenario 2: Network Troubleshooting - Cannot Access Websites

Ticket Summary:

The screenshot shows the OSTicket web interface in a browser. The ticket is titled "No Internet" and is in the "Open" status. The user is "Good User (6)". The ticket was created on 11/02/25 at 01:46:38. The user has posted a message stating they cannot connect to any websites and has attached a screenshot. The interface includes tabs for "Ticket Thread (1)" and "Tasks". A "Storage settings" notification is visible in the bottom right corner.

Ticket #834287

No Internet

Status: Open
Priority: Normal
Department: Support
Create Date: 11/02/25 01:46:38

User: Good User (6) (Manage Collaborators)
Email: gooduser@goodcorp.local
Source: API

Assigned To: — Unassigned —

Ticket Thread (1)

Good User posted 11/02/25 01:46:38 **No Internet**

I signed into my computer today and found that I can't connect to any websites. See my screenshot, I just get an error. This was working OK yesterday.

Hmmm.png 248.2 Kb

Created by **Good User** 11/02/25 01:46:38

Storage settings

We've turned on Storage Sense
To optimize storage usage, we've turned on Storage Sense for you.

Symptoms

- No websites access
- Browser shows connection errors
- Network interface appears connected

The screenshot shows a Google search page in a browser. The address bar shows "google.com". The page displays a message: "Hmmm... can't reach this page". Below this, it says "google.com's server IP address could not be found." and "Try: Checking the connection" and "Checking the proxy, firewall, and DNS settings." The error code "ERR_NAME_NOT_RESOLVED" is visible. There are "Troubleshoot" and "Refresh" buttons. The Windows taskbar is visible at the bottom.

Hmmm... can't reach this page

google.com's server IP address could not be found.

Try:

- Checking the connection
- [Checking the proxy, firewall, and DNS settings.](#)

ERR_NAME_NOT_RESOLVED

Troubleshoot **Refresh**

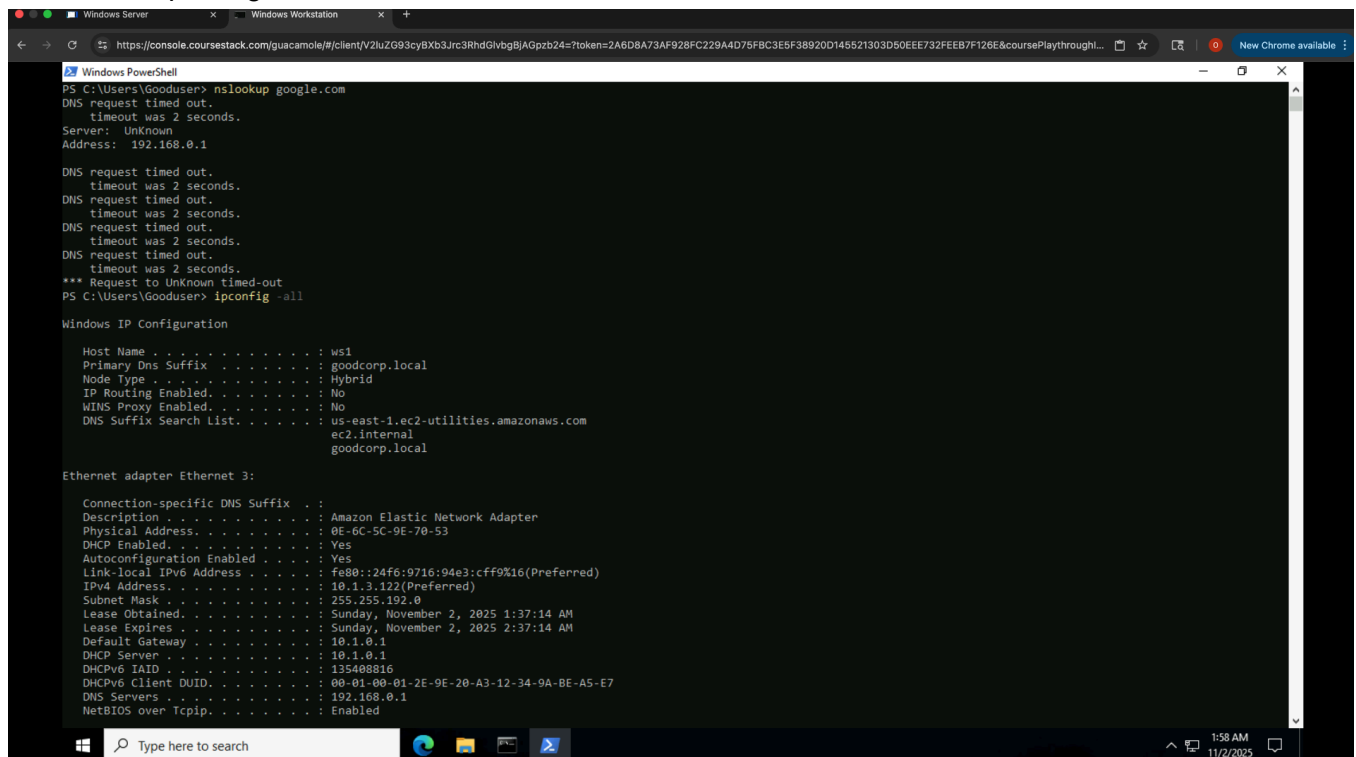

Details

Possible causes

- Incorrect DNS Server
- Wrong IP configuration
- Network adapter misconfiguration
- Proxy settings enabled
- Gateway unreachable

Resolution (What I Did)

1. Ran ipconfig /all

```
Windows PowerShell
PS C:\Users\Gooduser> nslookup google.com
DNS request timed out.
  timeout was 2 seconds.
Server: Unknown
Address: 192.168.0.1

DNS request timed out.
  timeout was 2 seconds.
DNS request timed out.
  timeout was 2 seconds.
DNS request timed out.
  timeout was 2 seconds.
DNS request timed out.
  timeout was 2 seconds.
DNS request timed out.
  timeout was 2 seconds.
*** Request to Unknown timed-out
PS C:\Users\Gooduser> ipconfig /all

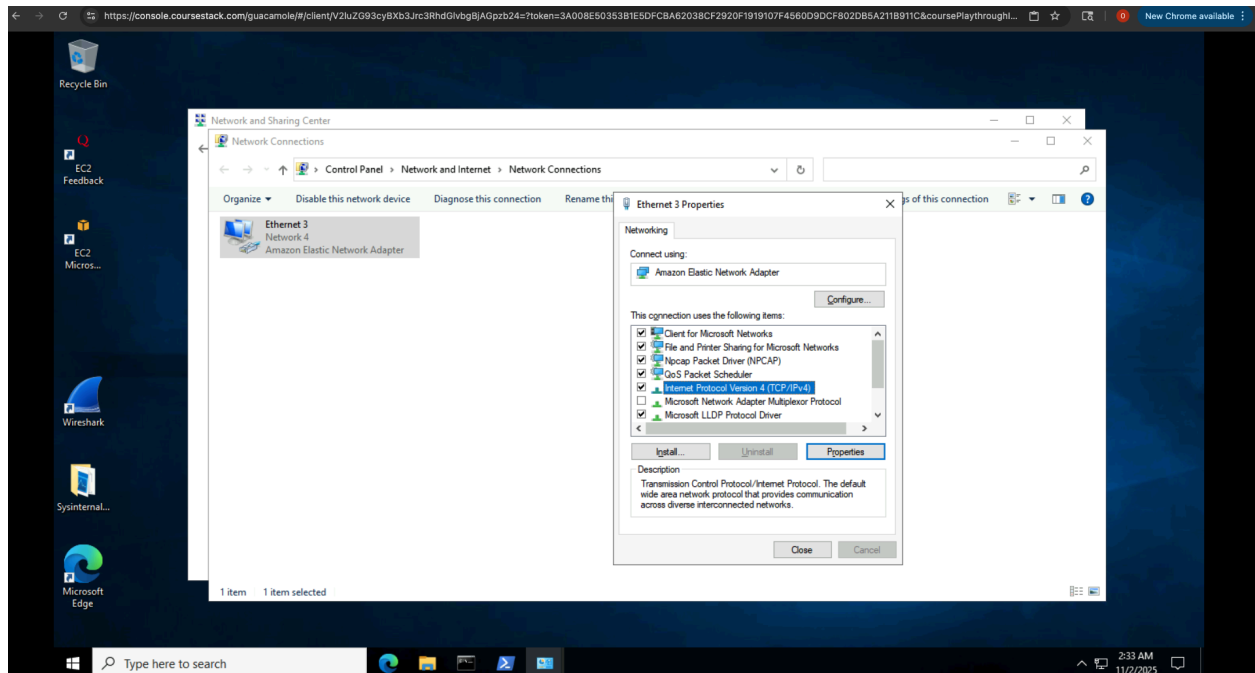

Windows IP Configuration

Host Name . . . . . : ws1
Primary Dns Suffix . . . . . : goodcorp.local
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No
DNS Suffix Search List. . . . . : us-east-1.ec2-utilities.amazonaws.com
                                     ec2.internal
                                     goodcorp.local

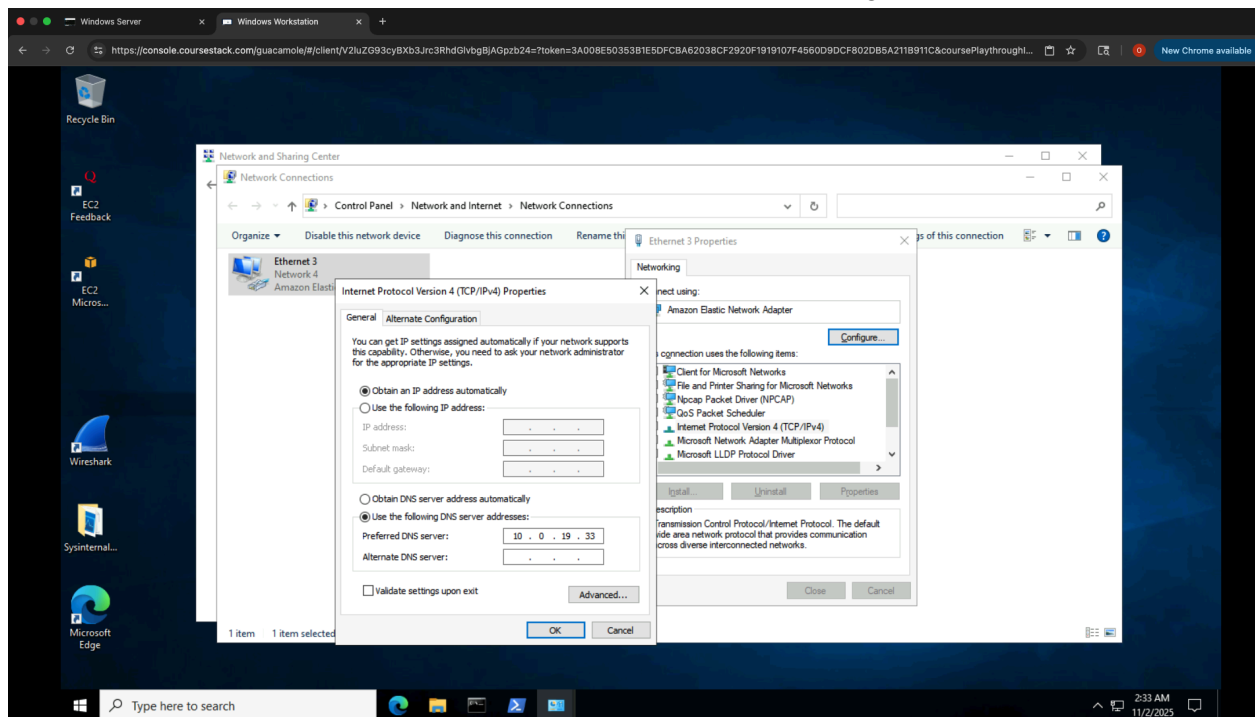

Ethernet adapter Ethernet 3:

   Connection-specific DNS Suffix  . : Amazon Elastic Network Adapter
   Description . . . . . : Amazon Elastic Network Adapter
   Physical Address. . . . . : 0E-6C-5C-9E-70-53
   DHCP Enabled. . . . . : Yes
   Autoconfiguration Enabled . . . . : Yes
   Link-local IPv6 Address . . . . . : fe80::24f6:9716:94e3:cff9%16(Preferred)
   IPv4 Address. . . . . : 10.1.3.122(Preferred)
   Subnet Mask . . . . . : 255.255.192.0
   Lease Obtained. . . . . : Sunday, November 2, 2025 1:37:14 AM
   Lease Expires . . . . . : Sunday, November 2, 2025 2:37:14 AM
   Default Gateway . . . . . : 10.1.0.1
   DHCP Server . . . . . : 10.1.0.1
   DHCPv6 IAID . . . . . : 135408816
   DHCPv6 Client DUID. . . . . : 00-01-00-01-2E-9E-20-A3-12-34-9A-BE-A5-E7
   DNS Servers . . . . . : 192.168.0.1
   NetBIOS over Tcpip. . . . . : Enabled
```

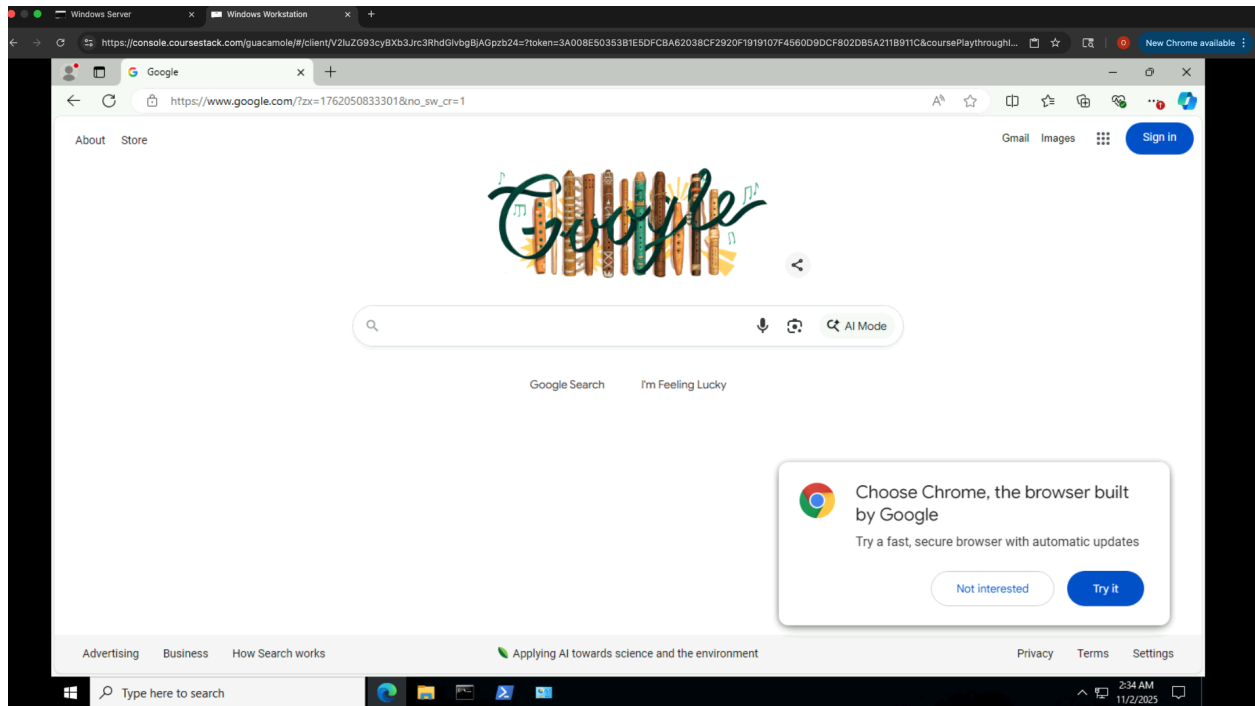

2. After running that command I immediately noticed that the workstation had the wrong DNS Server listed. It was not the same as the Domain Controller
3. Opened:
 - Control Panel
 - Network and Internet
 - Change adapter settings
 - Right click on the NIC - Properties
 - Internet protocol version 4 (TCP/IPv4)

4. Updates DNS to point to the Domain Controllers IP ensuring proper name resolution.

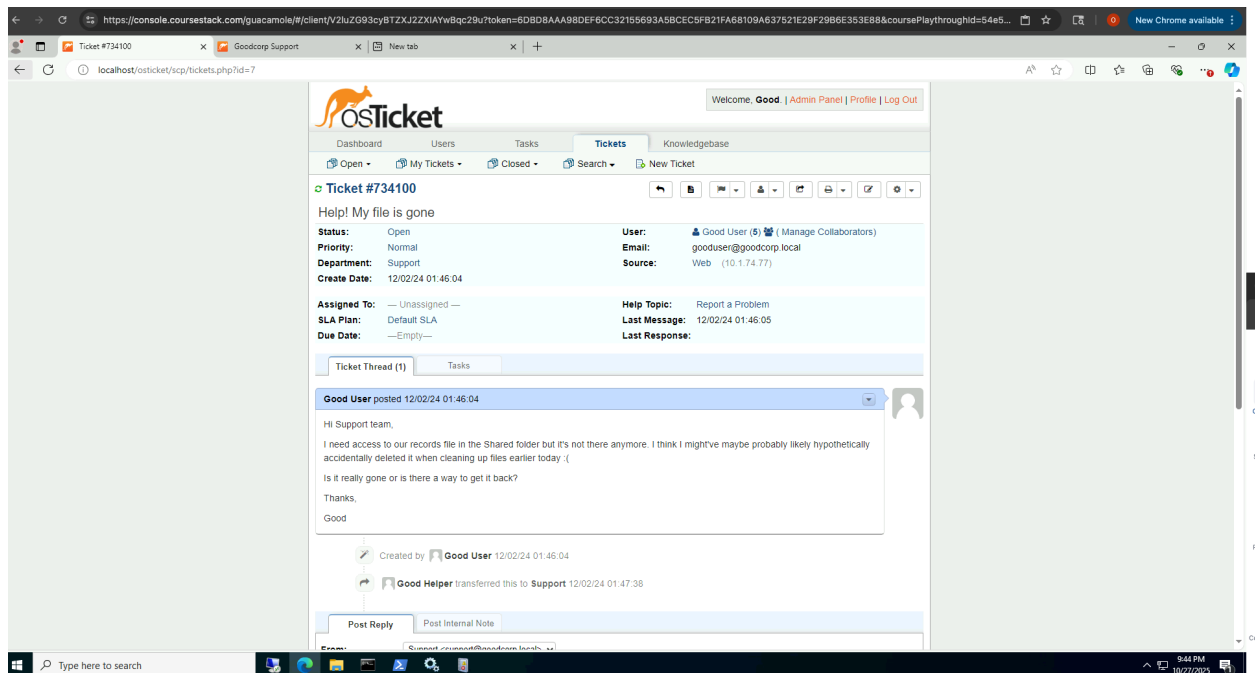

5. Saved settings and tested connectivity - internet access restored

Outcome: DNS corrected, websites loaded successfully and full connectivity was restored

Scenario 3: Lost Data - Shared Folder File Missing

Ticket Summary:

Symptoms:

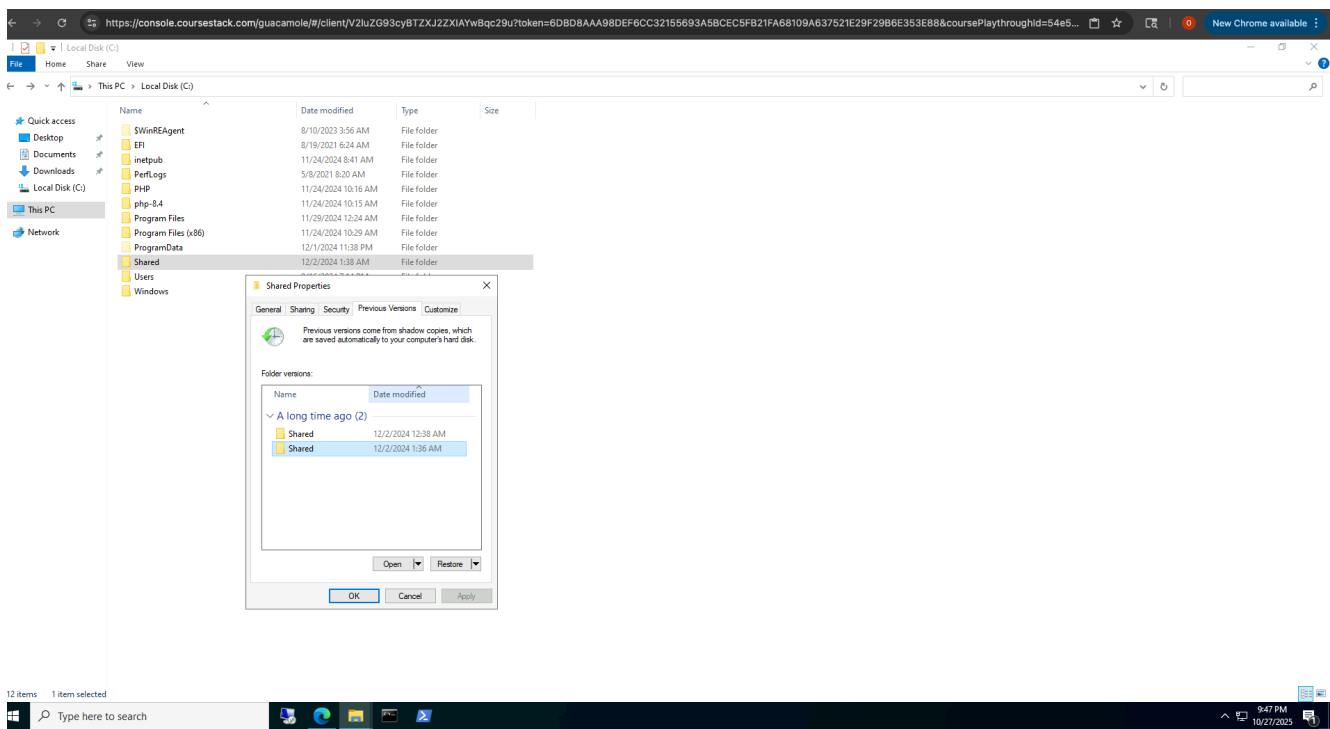

- Critical shared file missing
- User may have deleted the file
- Folder permissions appear correct

Possible Causes:

- File deleted by the user
- File moved or renamed
- Network Share permissions changed

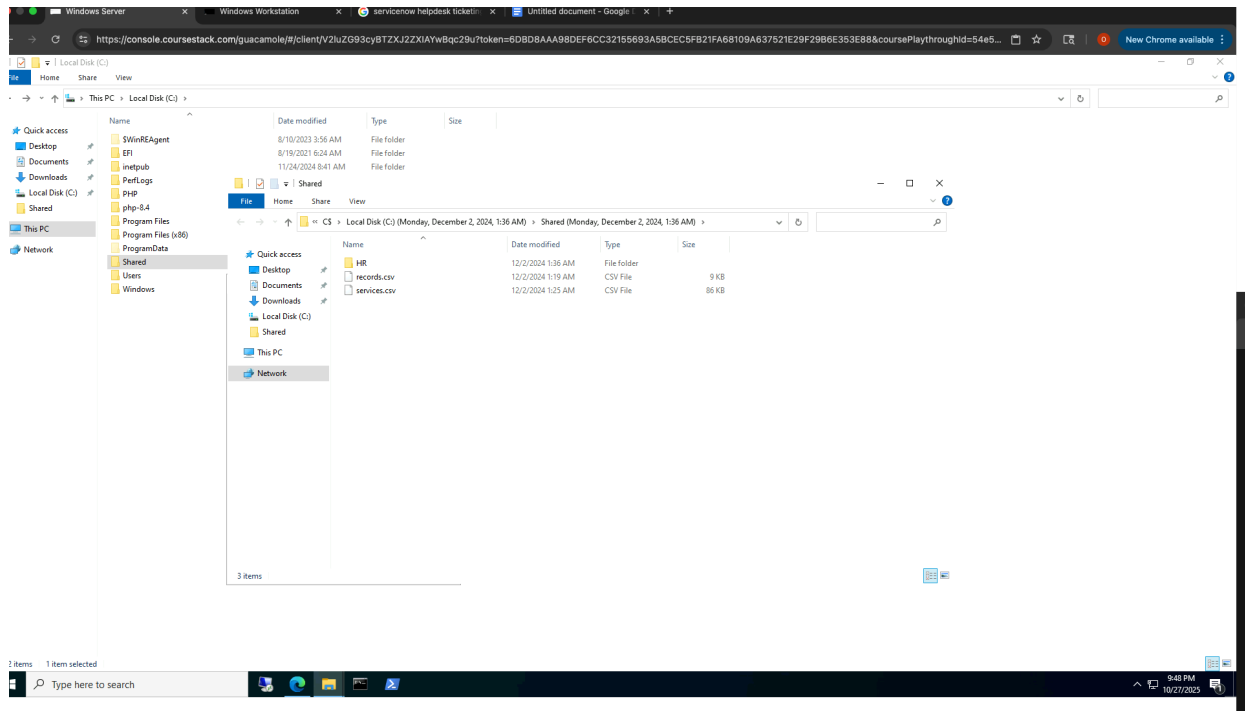

Resolution (What I Did)

1. Navigated to the shared folder - confirmed the file was missing
2. Right click on the shared folder and navigated to the Previous Versions

3. Located a previous version and restored the previous versions so the user can now access their records.

4. Confirmed the records file reappeared and was accessible to the user

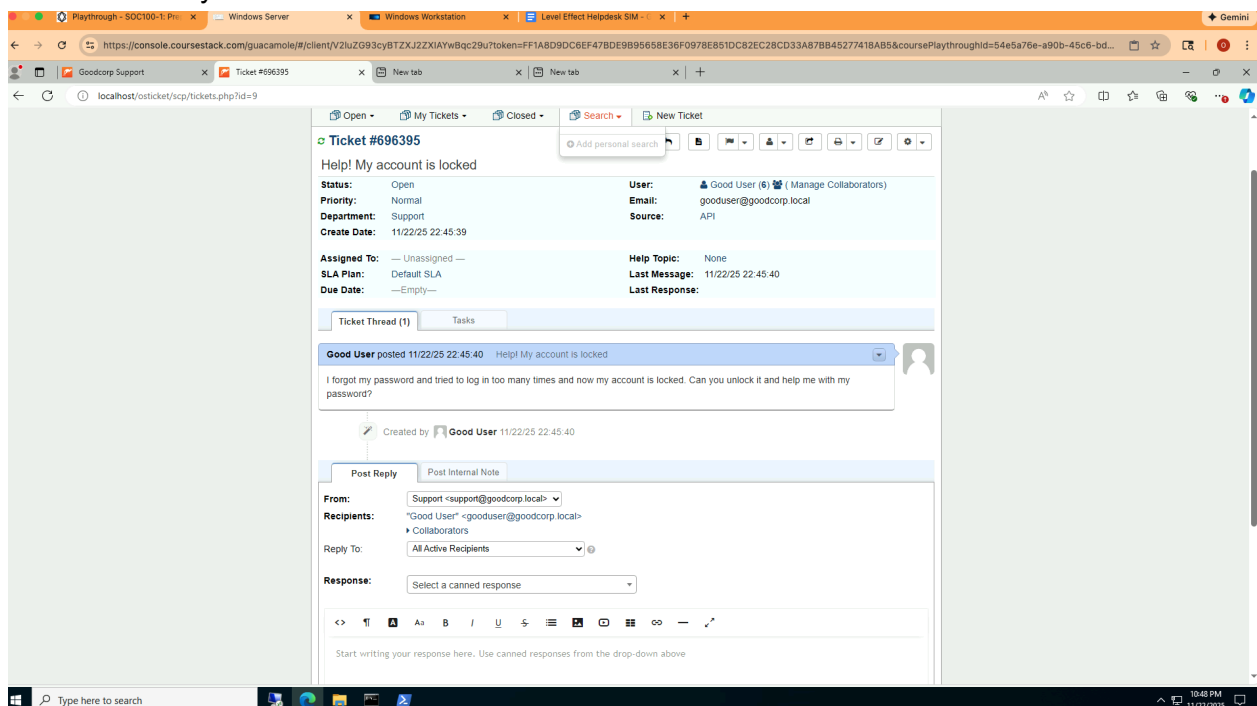

Outcome

The deleted file was successfully recovered using Shadow Copies/Previous Versions

Scenario 4: Brute Force / Account Lockout

Ticket Summary:

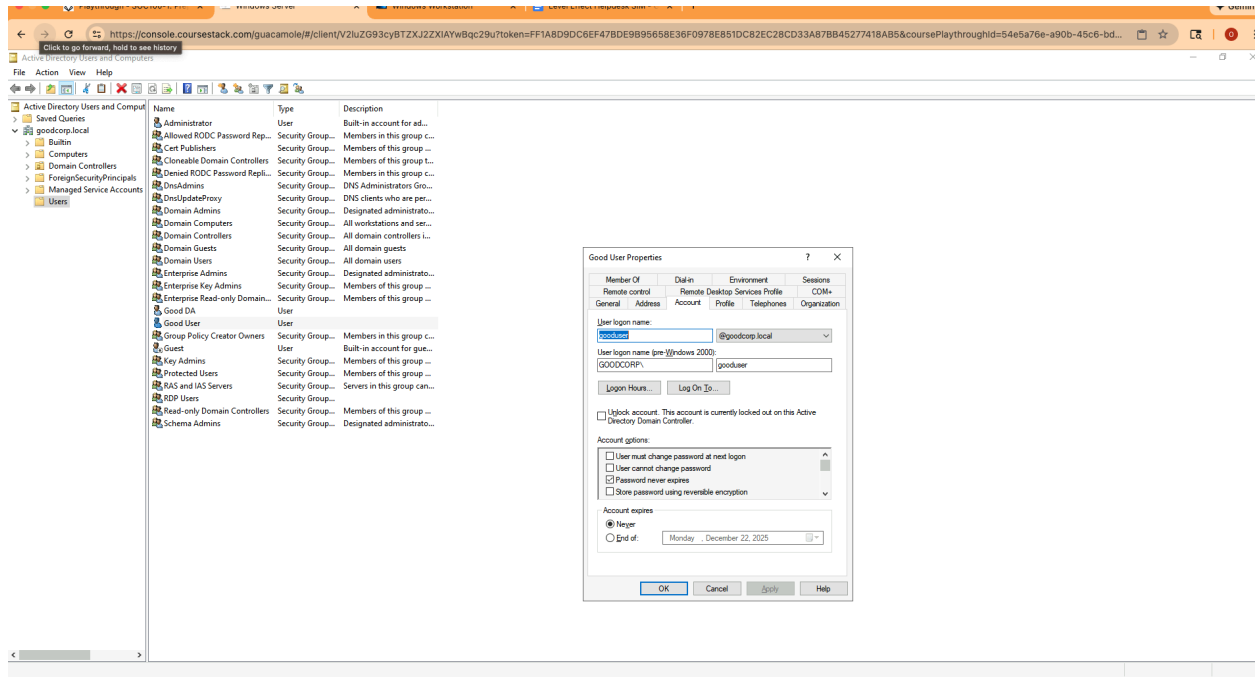

Symptoms

- User locked out of account
- Unable to log in due to AD lockout policy

Resolution:

- Opened Active Directory Users and Computers (ADUC) and found that the gooduser account is locked out.

- I unlocked the user account and reset the password to a temporary one and checked the box that said User must change password at next login.

Outcome

User regained access and successfully set a new password
